GRADATIONAL RED SANDY LOAM

General Description: Thick loamy sand to sandy loam overlying a massive red brown light sandy clay loam to sandy clay with minor carbonate nodules, grading to variable silty or sandy alluvium

Soil Description:

| Depth (cm) | Description |
|-------------|---|
| 0-12 | Dark reddish brown fine sandy loam with moderate granular structure. Clear to: |
| 12-35 | Dark reddish brown fine sandy loam with weak coarse blocky structure. Diffuse to: |
| 35-100 | Dark reddish brown fine sandy clay loam with weak coarse blocky structure. Clear to: |
| Buried soil | |
| 100-140 | Red massive loamy sand. Clear to: |
| 140-175 | Yellowish red massive fine sandy clay loam. Clear to: |
| 175-200 | Yellowish red soft massive loamy sand. |

Classification: Sodic, Eutrophic, Red Kandosol; thick, non-gravelly, loamy / clay loamy, deep

Summary of Properties

| Drainage | The soil is well drained and is never wet for more than a day or so. | | | | | | | | | |
|--------------------------|---|--|--|--|--|--|--|--|--|--|
| Fertility | The soil has moderate natural fertility, although the high pH may induce some trace lement deficiencies. Phosphorus and organic carbon levels are high. | | | | | | | | | |
| рН | Neutral at the surface grading to strongly alkaline with depth. | | | | | | | | | |
| Rooting depth | More than 200 cm in the pit. | | | | | | | | | |
| Barriers to root growth | | | | | | | | | | |
| Physical: | There are no apparent physical barriers to root growth as the soil is not excessively hard. | | | | | | | | | |
| Chemical: | There are no apparent chemical barriers to root growth. | | | | | | | | | |
| Water holding capacity | 150 - 200 mm in the root zone. | | | | | | | | | |
| Seedling emergence | Good, provided that organic carbon levels are maintained above 2%, as the soil tends to set hard. | | | | | | | | | |
| Workability | Good. | | | | | | | | | |
| Erosion Potential | | | | | | | | | | |
| Water: | Low. | | | | | | | | | |
| Wind: | Low to moderately low. The fine sandy surface will easily pulverize and blow if excessively worked. | | | | | | | | | |

Note: Row sample bulked from 20 cores (0-10 cm) taken from along the vine rows around the pit.

CEC (cation exchange capacity) is a measure of the soil's capacity to store and release major nutrient elements.

ESP (exchangeable sodium percentage) is derived by dividing the exchangeable sodium value by the CEC.
