CALCAREOUS SANDY LOAM

(Sandy Bookabie / Wiabuna soil)

General Description: Calcareous loamy sand to sandy loam grading to a very highly

calcareous light sandy clay loam with variable rubble, extending

below 120 cm

Landform: Very gently undulating

rises.

Substrate: Very highly calcareous

light sandy clay loam (Woorinen Formation).

Vegetation: Mallee / tea tree

EF014 **Type Site:** Site No.:

1:50,000 sheet: 5534-2 (Koonibba)

Annual rainfall: 325 mm

Landform: Upper slope of 1% Soft with no stones Surface:

No landscape image available

Hundred: Catt 17/01/92 Sampling date:

Soil Description:

Depth (cm)	Description
------------	-------------

0 - 10Dark brown soft weakly blocky moderately

calcareous light sandy loam. Clear to:

10-25 Dark brown firm highly calcareous sandy loam

with moderate blocky structure. Clear to:

25-45 Orange friable very highly calcareous sandy loam

with weak subangular blocky structure. Clear to:

45-60 Orange friable very highly calcareous sandy loam

with weak subangular blocky structure and 20-

50% carbonate nodules. Gradual to:

60-100 Orange firm very highly calcareous light sandy

clay loam with weak subangular blocky structure.

Diffuse to:

100-150 Reddish yellow friable very highly calcareous

light sandy clay loam with weak subangular

blocky structure. Diffuse to:

150-200 As above.

Classification: Epihypersodic, Regolithic, Supracalcic Calcarosol; medium, non-gravelly, loamy/loamy, deep

Summary of Properties

Drainage Rapidly drained. Soil is never wet for more than a few hours.

Fertility Inherent fertility is low as indicated by the exchangeable cation data. Low clay and

organic matter levels provide little nutrient retention capacity. Regular phosphorus applications are essential - levels are marginal at sampling site. Nitrogen levels depend on cropping history and medic content of volunteer pastures. Copper and zinc

deficiencies may occur - levels are marginal at sampling site.

pH Alkaline at the surface, strongly alkaline with depth.

Rooting depth 60 cm in pit.

Barriers to root growth

Physical: There are no physical barriers.

Chemical: High pH, sodicity and boron concentrations from 45 cm limit root depth.

Water holding capacity Approximately 70 mm in root zone.

Seedling emergence: Satisfactory.

Workability: Soft surface is easily worked

Erosion Potential

Water: Low.

Wind: Moderate.

Note: CEC (cation exchange capacity) is a measure of the soil's capacity to store and release major nutrient elements.

ESP (exchangeable sodium percentage) is derived by dividing the exchangeable sodium value by the CEC
