STONEHURST SUGARLOAF

This land system includes an extensive area of rugged dolerite hills and associated flats in the Nugent, Orford, Buckland area.

Crests and upper slopes contain a shallow (e.g. <0.50 m), stony, duplex soil with a clay loam surface over a light olive brown to dark greyish brown clay. This supports a woodland dominated by *Eucalyptus amygdalina*, *Eucalyptus pulchella* and *Eucalyptus globulus* with an understorey of *Acacia dealbata*, *Exocarpos stricta*, *Themeda australis*, *Bursaria spinosa*, *Acrotriche serrulata*, *Astrolooma humifusum*, *Poa sp.*, *Lepidosperma latex-ale* and *Casuarina stricta*,

Mid-slopes contain a stony, shallow (0.60 m), duplex soil with a clay loam surface over a dark yellowish brown clay. Protected slopes and gullies have a deep duplex soil consisting of a clay loam surface over brown clay. This sustains an open forest dominated by *Eucalyptus obliqua* and *Eucalyptus globulus* with a dense understorey of *Pomaderris apetala*, *Acacia verticillata*, *Bursaria spinosa*, *Goodenia ovata*, *Olearia lirata* and *Bedfordia salicina*.

Flats contain a deep (1.00 m) gradational soil with a clay loam to light clay surface over a medium to heavy clay that varies considerably in colour. This supports a woodland dominated by *Eucalyptus ovata*, *Eucalyptus amygdalina* and *Eucalyptus globulus* with an understorey of *Diplarrena moraea*, *Acacia dealbata*, *Casuarina littoralis*, *Lomandra longifolia*, *Themeda australis*, *Acacia melanoxylon*, *Pomaderris apetala*, *Bursaria spinosa* and *Exocarpos cupressi formis*.

The land system is mainly used for forestry, grazing and recreation. It is not particularly susceptible to erosion although sheet, rill and gully erosion problems are sometimes evident after major disturbance. Waterlogging and flooding hazards are associated with the drainage flats. The Eastern Tiers (372241) and the Chimney Pot Hill (372143) are closely related to this land system.
