LAND USE	Grazing, Cropping					
HAZARDS	High Sheet, Rill, Gully and Tunnel Erosion					
	Moderate/High Riverbank Erosion/Flooding					

COPPING HILLS

This small land system is located near Copping and consists of hills and associated flats formed on interbedded sequences of mudstone and sandstone.

Sandstone crests contain a shallow (0.30 m), uniform sand or loamy sand developed on bedrock. This supports a woodland dominated by *Eucalyptus amygdalina* and sometimes *Eucalyptus globulus* with a heathy understorey that includes *Lomandra longifolia*, *Lomatia tinctoria*, *Viola hederacea*, *Astroloma humifusum*, *Leptorhynchos squamatus*, *Stylium graminifolium*, *Stipa* sp., *Hypericum* sp., *Helichrysum scorpioides* and *Wahlenbergia* sp.

Mudstone crests have a shallow (0.50 m), duplex soil with a fine sandy loam surface over a yellowish brown heavy clay that sometimes has a brown mottle. This supports a woodland dominated by *Eucalyptus amygdalina*, and occasionally *Eucalyptus obliqua*, with an understorey that includes *Pteridium esculentum*, *Lomandra longifolia*, *Acacia dealbata*, *Pultenaea juniperina* and *Exocarpos cupressiformis*.

Sandy slopes contain a deep (>1.40 m), duplex soil with a loamy sand to sand surface over a yellowish brown clay. This supports a woodland dominated by *Eucalyptus amygdalina* with a heathy understorey of *Pteridium esculentum*, *Banksia marginata*, *Bossiaea cinerea*, *Lepidosperma concavum*, *Amperea xiphoclada*, *Leucopogon collinus*, *Epacris impressa*, *Leptospermum scoparium*, *Aotus ericoides*, *Casuarina monilifera*, *Lomandra longifolia* and *Exocarpos cupressiformis*.

Mudstone slopes have a deep (0.70 m), duplex soil with a fine sandy loam surface over a brownish yellow, heavy clay. This supports a woodland dominated by *Eucalyptus amygdalina*, *Eucalyptus viminalis* and *Eucalyptus obliqua* with a heathy understorey that includes *Lomandra longifolia*, *Lepidosperma concavum*, *Casuarina littoralis*, *Leptospermum scoparium*, *Tetratheca glandulosa*, *Leucopogon ericoides* and *Lissanthe strigosa*.

Sandy flats contain a deep, uniform sand that varies in colour from very dark brown to yellowish brown to dark yellowish brown. This supports a woodland/open forest dominated by *Eucalyptus viminalis* with a heathy understorey of *Pteridium esculentum*, *Acacia dealbata*, *Acacia melanoxylon*, *Pomaderris apetala*, *Cassinia aculeata* and *Lomandra longifolia*.

River flats have a deep (>1.40 m), duplex soil with a sandy clay loam surface over a greyish brown to yellowish brown, heavy clay. This supports an open forest dominated by *Eucalyptus obliqua*, *Eucalyptus ovata*, *Eucalyptus viminalis* and *Eucalyptus amygdalina* with a scrubby understorey that includes *Acacia dealbata*, *Pomaderris apetala*, *Cassinia aculeata*, *Lomandra longifolia*, *Pultenaea juniperina*, *Lepidosperma elatius* and *Juncus* sp.

Grazing is the major land use although cropping is also evident in some areas. The country is particularly prone to erosion problems, notably sheet, rill, gully, tunnel and streambank erosion. Flooding hazards are associated with the river flats.
